BYP GLOBAL
MARKETING ENGINEERING

WHO ARE WE?

We consider ourselves **marketing engineers**.
We make the most stunning ideas become reality
to communicate your brand at the Point of Sale.

Our aim is to create products that will fulfill our
client's needs by using or combining different
materials such as metal, wood, plastic or leather
together with electronic components, which
allow us to light up any of our designs.

At BYP we have a senior consultancy team who
have a solid knowledge on materials, decoration
techniques and manufacturing processes.

Their task consist on choosing the best product
materials adapting them to the industrial design
and saving costs in the production process.

MISSION AND VISION

BYP Global was born 35 years ago with the aim
to offer a full service in Marketing Engineering
to beverages and spirits companies.

We are a global reference in the POS industry
thanks to our design, production and distribution
capabilities. At the end of the day, what we
do is help our client's brands stand out where
the buying decision is being taken. We believe
in the combination of elegant designs and the
accuracy of manufacturing. This is why we work
every day to continue improving so as to be
a step ahead of our client needs.

FOCUSED CREATIVITY & HOLISTIC APPROACH

STRATEGIC PROCUREMENT & MANUFACTURING

Our focus is based on Total Acquisition Cost, looking after direct and indirect cost efficiency, manufacturing, transportation and suppliers optimization.

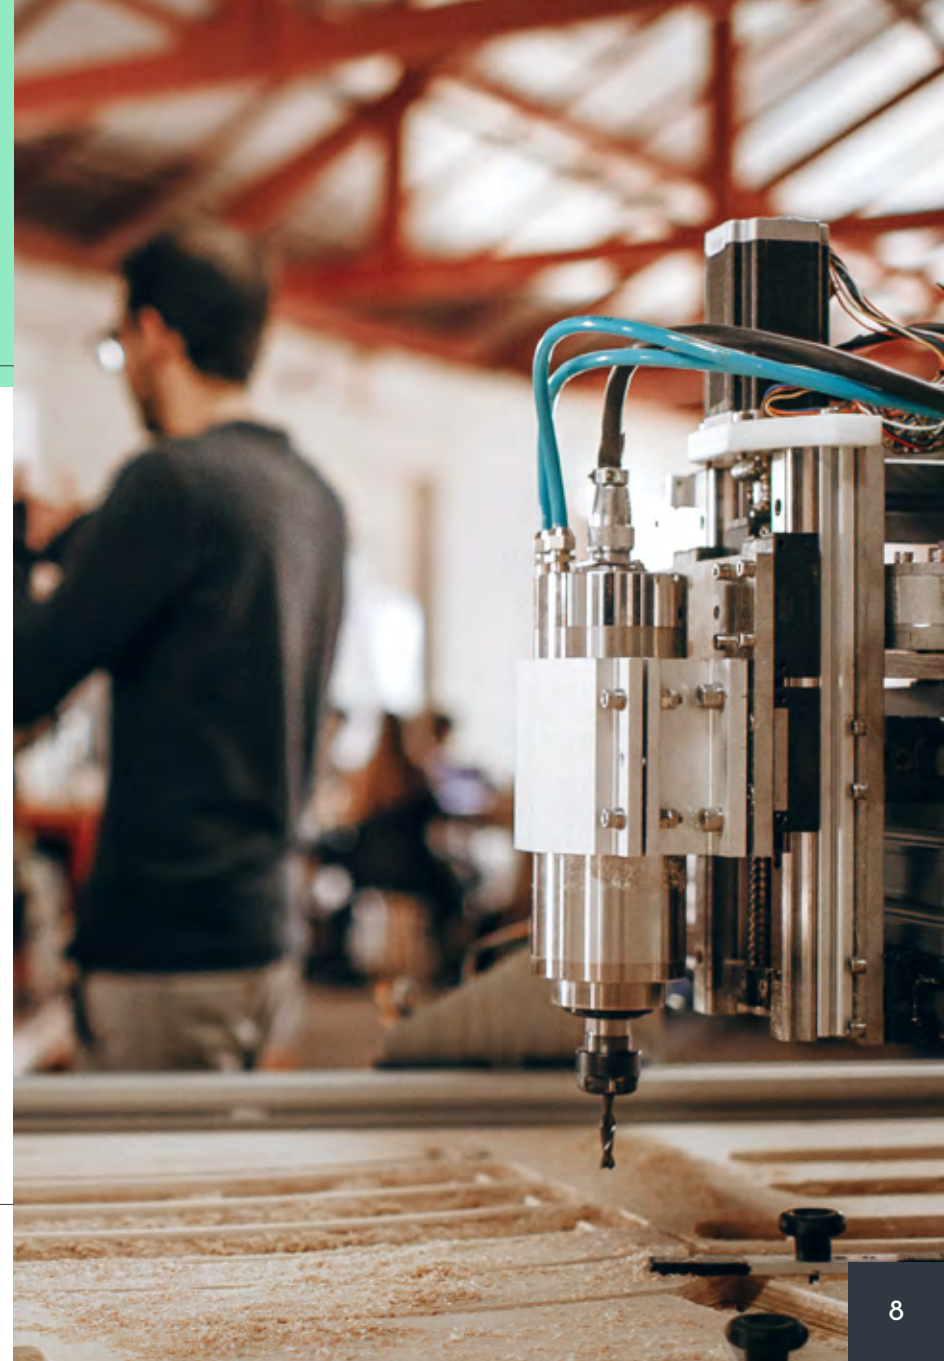

When working strategically on global projects we aim to reduce costs through optimizing operations, on both, design and production processes, in order to achieve synergies, safe time on deliveries and brand harmonization.

DIRECT COST OPTIMIZATION:

- Benchmarking;
- Kaizen methodology;
- Just In Time production;
- Product development;
- Cargo consolidation.

OVERHEADS OPTIMIZATION:

- Team efficiency;
- Resources optimization per project.

CERTIFICATION IN SOCIAL RESPONSIBILITY SUPPLY CHAIN

Our internal QA team is responsible of supplier's audits, production planning, QC inspections, traceability and CSR.

Additionally, we accomplish external audits with reliable companies such as BV, SGS or Intertek.

Our work with them consists on:

1. Risk analysis;
2. Brand identity following up;
3. Technical briefing;
4. Supplier's audit;
5. Hiring;
6. Production;
7. Q.C;
8. Pre-shipment inspection: AQL II, FDA;
9. Technical file;
10. Supplier's management.

WORLDWIDE EXTENSION

BYP is present in three different continents:
Europe, America and Asia.

ROOSTER ROJO SHOT GLASS TRAY

PENTAWARD BRONZE 2022

We are proud to announce that we won our first **Pentawards** (Bronze) in the category of **Brand Identity and Connected Packaging**. The Rooster Rojo shot glass tray encapsulates the essence of the brand, in a fun, functional and unique product for the point of sale. We are looking forward to keep on innovating our products and surprise our customers in 2023.

LOVE MY BAR[®]

A YEAR OF HOSPITALITY REVOLUTION

Love My Bar was born to offer customisation to any place that wants to both renew its image and polish it. We provide everything from tableware to all kinds of blackboards, including ice buckets, banners and menus.

The service is 100% **personalised**. Our motto is 'Turn your business around' and our vision is 'the revolution in the room'.

Our products give the perfect touch to all types of premises thanks to detailed customization.

Throughout 2022, Love My Bar has provided services to hospitality leaders such as the Nembus Gourmet group, it has entered the hotel world with Silken hotels, and franchises such as Burritos have trusted us, in Madrid, Barcelona and Valencia, and Ovejas Negras, among many others.

Our star material is sustainable certified wood (FSC and PEFC). We recycle and reuse all products that do not go on the market. We achieve a unique customization of the product thanks to laser engraving and digital printing.

We love making ourselves known, which is why, in March 2022, we attended the Hospitality Innovation Planet (HIP) fair, where we were able to show the world what we do and how we do it.

Our products have also participated in the National Meeting of Hoteliers and Chefs (FACYRE), whose organizers trusted us for the signage of the event.

2023 is coming up strong, and we are already cooking news in the oven... **Stay tuned!**

CASE STUDY

LA PELLE X CORONA

Corona brewery requested the services of **BYP Global** to create a wooden bar counter for **Club La Pelle** in **Marseille**.

The design and production process consist of the following nine steps:

1. We receive the order from Corona.
2. We send visuals with our proposals.
3. We redesign as many times as necessary for the client to be happy. They usually ask for the price of several proposals and select one amongst them.
4. They request small changes in details, such as the size and position of the logo.
5. They ask for a prototype. In this case, since the production consists of one unit, there is no sample. We send photos of materials and colors for approval.

PROPOSAL 1

PROPOSAL 2
SELECTED BY
CORONA

BEFORE

AFTER

- 6.** In this case, Natalia personally travels to Marseille to measure the space available in the bar.
- 7.** The technical drawings are sent to the supplier and the product is manufactured with our quality control supervision.
 - a.** Lacquered tubular metal structure.
 - b.** The wooden plates are engraved. We use a special wood to withstand humidity and temperature changes, since the bar is meant for outdoor use.
 - c.** The components are varnished in order to last longer outdoors.
 - d.** The plates are assembled to the structure and the metal sheets are manufactured (the area where the handle and the sink are to be anchored).
- 8.** Once the furniture is assembled, quality tests are carried out.
- 9.** The bar is disassembled, packed and shipped.
- 10.** The product is assembled at Club La Pelle in Marseille.

FINAL RESULT: LA PELLE X CORONA

9.0 BARWARE

Larios 12 es una ginebra Premium de excelente calidad que nace de una exótica combinación de 12 especies botánicas extraídas directamente de la naturaleza, en 5 destilaciones.

Los ingredientes propios de la ginebra: bayas de enebro salvaje, cilantro, nuez moscada y raíz de albaricoque se unen los cítricos más refrescantes: limón y naranja del Mediterráneo, dos mandarinas -mandarina clementina y mandarina tangerina-, pomelo y lima. Y el toque dulce del azúcar, para garantizar un aroma exótico, de sedoso tacto al paladar.

DO YOU WANT TO
LEARN MORE ABOUT
SUSTAINABILITY?

← [Back to Index](#)

FOR A BETTER WORLD

SUSTAINABILITY

Sustainable development means meeting the needs of the present whilst ensuring future generations can meet their own needs. This means that there is not a global solution: any project needs to be accurately studied to find the most sustainable and economic solution.

HOW CAN WE COOPERATE WITH THE ENVIRONMENT?

Going further than certificate ourselves in an environmental System Standard, we also keep special attention to where the crude material comes from. In order to assure the sustainability of our products, we ask our raw material suppliers the certificates that assure that their products comes from sustainable sources. Depending on the material's area, different solutions are released:

- Wood
- Acrylics and Plastics
- Metals
- Electronic components

RoHS

NOW IT IS POSSIBLE TO DESIGN INNOVATION AND ENVIRONMENTAL CONSCIOUS MARKETING ELEMENTS.

ISO 14001. ENVIRONMENTAL MANAGEMENT SYSTEMS STANDARD

The International Organization of Standardization (ISO) defines an environmental management system as *“part of the management system used to manage environmental aspects, fulfil compliance obligations, and address risks and opportunities.”*

BYP-Global is a certified follower of the Environmental Management System Standards in order to show their commitment in environmental management.

ECO-DESIGN PRINCIPLES

Eco-design means producing goods and services that meet your customers' needs while:

- Using the minimum levels of resources;
- Having a minimum impact on the environment and society.

Eco-design involves designing or redesigning products, services, processes or systems to avoid or repair damage to the environment, society and the economy. Ecodesign is present all around us - in sustainable flooring, green energy heating systems, eco-friendly packaging and even recyclable products.

WHEN SHOULD WE CONSIDER IT?

Project with large environmental impacts or natural resource use are the best candidates for an eco-design transformation. However, you can apply eco-design principles even in the smallest of projects by making sure that you:

- Maximise the use of sustainable materials;

- Use the least amount of energy necessary;
- Design a product so that it can be recycled or reused at the end of its lifecycle.

THERE ARE TEN CORE ENVIRONMENTAL CONSIDERATIONS AT THE HEART OF ECO-DESIGN:

1. Using materials with less environmental impact;
2. Using fewer materials overall in the manufacture of products;
3. Using fewer resources during the manufacturing process;
4. Producing less pollution and waste;
5. Reducing the environmental impacts of distributing products;
6. Ensuring that products use fewer resources when they are used by end customers;
7. Ensuring that products cause less waste and pollution when in use;
8. Optimising the function of products and ensuring the most suitable service life;
9. Making reuse and recycling easier;
10. Reducing the environmental impact of disposal.

**BYP GLOBAL HAS OBTAINED AN
ECO-DESIGN CERTIFICATION.**

**WE DO OUR BEST TO
USE AS MANY ECO-
FRIENDLY MATERIALS
AS POSSIBLE.**

WOOD

The Forest Stewardship Council (FSC), is an independent, non-profit and non-governmental organization, based in Bonn, Germany. The mission of the Forest Stewardship Council, is to support environmentally appropriate, socially benefit and economically viable management of the world's forest.

This means that the original forests of those woods agree with these **10 principles** of FSC, which are:

- #1** Compliance with laws and FSC Principles
- #2** Tenure and use rights and responsibilities
- #3** Indigenous peoples' rights

- #4** Community relations and worker's rights
- #5** Benefits from the forest
- #6** Environmental impact
- #7** Management plan
- #8** Monitoring and assessment
- #9** Maintenance of high conservation value forests
- #10** Plantations.

PEFC'S PROGRAM

PEFC is an international non-profit, non-governmental organization, dedicated to promote Sustainable Forest Management (SFM) through independent third-party certification, PEFC works throughout the entire forest supply chain to promote good practice in the forest, and to ensure that timber and non-timber forest products are produced with respect of the highest ecological, social and ethical standards.

PEFC's distinctive "green trees" logo, makes this brand credible around the world, and makes customers and consumers able to identify products from sustainably managed forests.

- Sets robust standards and realistic criteria for sustainable forest management at a global level that enjoy acceptance by stakeholders around the world, and that are continuously updated to incorporate new knowledge, best practices and changing expectations.
- Is flexible enough to reflect the specific national circumstances as elaborated with input from all interested parties at local level, yet is also in compliance with international requirements.
- Is accessible, viable and affordable not only to multinational corporations managing large areas of natural forests and plantations, but also to the millions of small family and community-forest owners.

METALS

Due to their 100% easy recycling possibilities, all metals used nowadays comes from double life sources.

The main problems in recycling this products comes from the fact of mixing materials or different kinds of metal, making it difficult to later separate each one.

In order to reduce the difficulties of recycling metals, the best proposal to ensure that these products will be recycled, is to ease the disassemblation of the different parts. Another option is to develop products that use just one type of metal.

ACRYLIC & PLASTICS

For Acrylic and Plastic products BYP Global tries its best to use recycled raw material as much as possible.

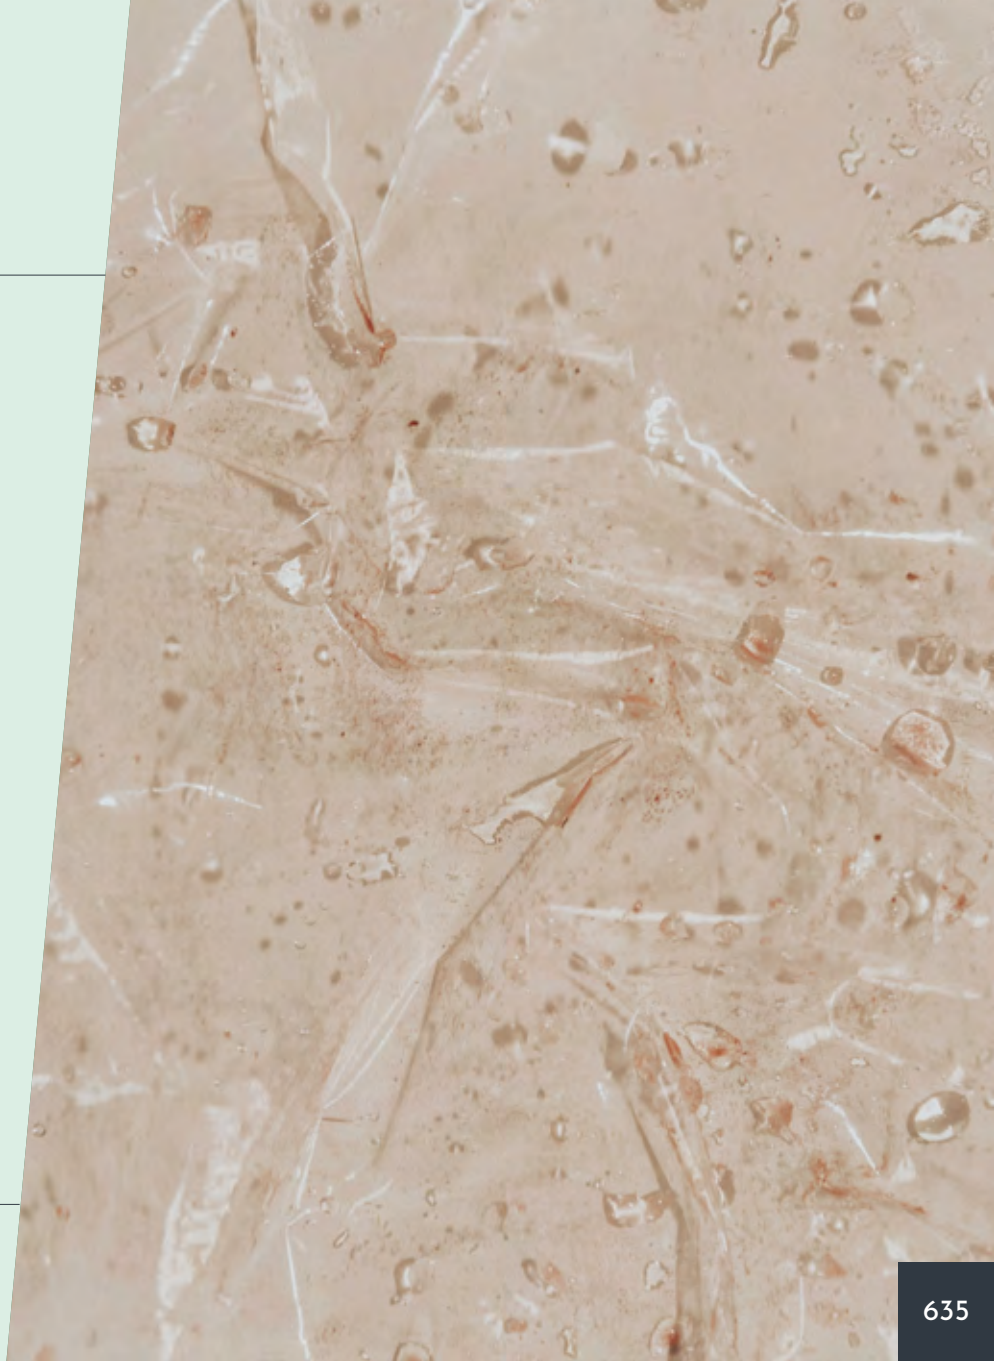

For acrylic and plastic products BYP Global's products can be 100% recycled; this is yet not sustainable enough and our innovation department is in charge of finding new solutions. In order to reduce the quantity of rubbish made out of plastic around the world, several changes on our products' new materials need to be done.

Recycled plastic is always a way to resure raw materials instead of throwing them away, ending their lifespan.

For POC materials there will always be two limitations:

1. Transparency
2. Food Safety

If there isn't a very clear and transparent information about the origin of the recycled raw material it cannot be used for products in contact with food.

PLASTIC MANUFACTURING: LOOKING FOR MORE SUSTAINABLE SOLUTIONS

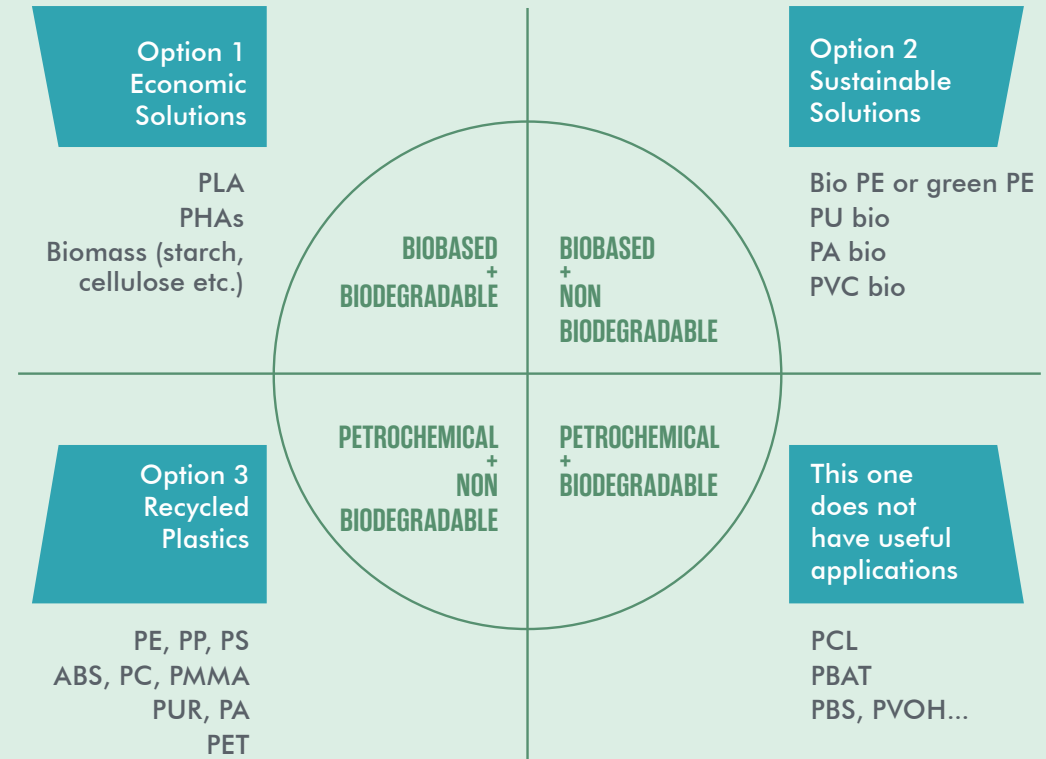

The graphic on the right shows 4 options of new plastic manufacturing nowadays, depending on the source of origin and their position on the market.

ORIGIN:

- Biobased: It comes from a renewable resource.
- Petrochemical: It comes from fossil sources.

END:

- Biodegradable: Biodegradable plastics are polymers that degrade completely transforming into natural elements. They can come from a biobased origin or they can be produced by fossil resources.
- Non-Biodegradable: The contrary.

RECYCLED PLASTIC

The only possible recycled plastic approved to be used in contact with food at present is Recycled PET (PET-R) after a purification treatment or “supercleaning” and optimal traceability.

Buckets can be made from PET-R suitable for contact with food. Then, there is the option of getting any conventional plastic as a second material (this means that it is the exclusive waste of manufacturing: leftovers, defective products, etc.).

For recycling other plastics different than PET we should use a functional barrier: which means that the part

of the product which will be in contact with food will be protected with a very slight layer from a not recycled raw material with foodsafety certification.

This option is expected to be the most expensive, while a double injection would have to be done, however, our suppliers can be questioned. The tendency for plastic products to have good traceability is to favour the use of monolayers (of a single compound).

BIOPLASTICS

What is a bioplastic?

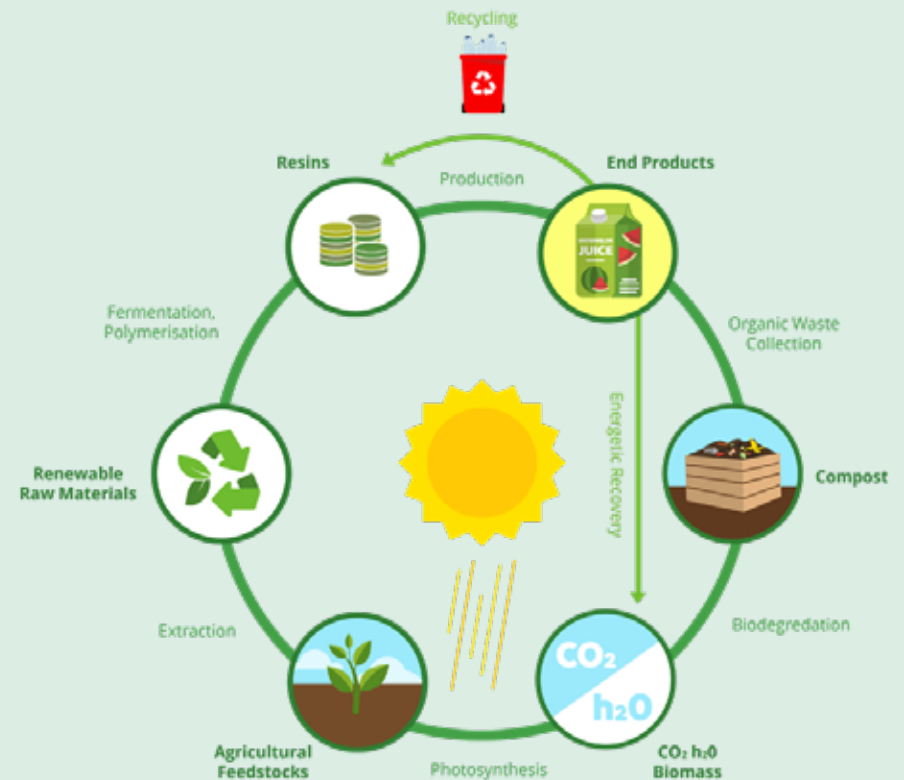

Bioplastic is a plastic whose source of origin is biobased or at the end of its life it can be biodegradable, or both.

MAIN FAMILIES OF BIOPLASTICS:

- **PLA (Polyactide or polylactic);**
- **Starch derivatives;**
- **Cellulose derivatives;**
- **PHAs (Polyhydroxyalkanoates).**

There is a wide variety of applications for each of these families. In addition, it is very common to find them mixed in the market.

After studying them carefully, PLA is the most useful tool right now, as a short term solution. However, we commit ourselves to continue investigating and to customise each study depending on our clients' requirements..

PLA. BIOPLASTIC MADE FROM CORNSTARCH

(+) PROS:

- 100% Compostable
- 100% Biodegradable
- Less CO2 emissions and energy used
- Innovation

(-) CONS:

- 57 °C
- Type 7 plastic
- 1.62 KG Corn grain and 0.81 KG Corn stover for 1 KG of PLA

Considering PLA as plastic type #7 and its difficult conditions to compost makes it a possible option for a near future, where compost yards are prepared for desintegrating this material.

PRODUCT COMPARISON:

RESINS	ENERGY	EMISSIONS	WATER
PLA (Corn)/lbs	7.39 kWh	0.27 lbs of Co2	8.29 Gallons
PP (Plastic)/lbs	9.25 kWh	1.7 lbs of Co2	5.16 Gallons
PET (Plastic)/lbs	10.17 kWh	2.8 lbs of Co2	7.44 Gallons

PHA. BIOPLASTIC MADE FROM CORNSTARCH

(+) PROS:

- 100% Compostable
- 100% Biodegradable
- Less CO2 emissions and energy used
- Innovation

(-) CONS:

- 1 year lifespan
- Type 7 plastic

PHA is another bioplastic alternative that can be composted by home composting and also by water.

The problem is that its price is 3 times PLA and its lifespan is around one year depending on the use it has and the temperature conditions in which it is located.

PRODUCT COMPARISON:

RESINS	ENERGY	EMISSIONS	WATER
PLA (Corn)/lbs	7.39 kWh	0.27 lbs of Co2	8.29 Gallons
PP (Plastic)/lbs	9.25 kWh	1.7 lbs of Co2	5.16 Gallons
PET (Plastic)/lbs	10.17 kWh	2.8 lbs of Co2	7.44 Gallons

PBAT. BIOPLASTIC MADE FROM SYNTHESIZED POLYMER

(+) PROS:

- 100% Compostable
- 100% Biodegradable
- Less CO2 emissions and energy used
- Innovation

(-) CONS:

- Does not come from a biobased material
- Type 7 plastic

PBAT has a price between PHA and PLA, but it is coming from not biobased materials. It is sustainable while we keep using fossil fuels for our transport in car where the waste is already done and better than common plastics.

HOW SHOULD COMPOSTABLE PLASTIC BE TREATED?

Bioplastics can be treated as conventional plastics, so they can be recycled to be used again for new products or they can degrade in nature by composting.

Composting is a procedure handled by the humans that advances the natural processes of biological decomposition and gives as products carbon dioxide, water, minerals and compost.

Compostable plastics decompose by more than 90% in six months, composting conditions according to the European standard UNE-EN ISO 13432 (US ASTM D6400-04).

TYPES OF COMPOSTABILITY

Domestic Composting:

It is done at room temperature with humidity and microorganisms. It can be done at home.

Industrial Composting:

It is carried out at high temperature (50-70% degrees), high humidity and microorganisms.

BIODEGRADABILITY. EXPOSING SOME OF THE MYTHS & FACTS

SOURCE: WWW.INNPROBIO.EU

Sometimes it seems that being “biodegradable” is all the rage for bio-based and other materials.

It sounds so good: at the end of its life, a product will decompose and go back to where it came from. That is, decompose back into the natural environment and reduce littering. However, looking a bit more deeply into the issue, it becomes clear that many misunderstandings, myths and confusion govern the discussion.

Here is our contribution to a bit more clarity.

MYTH N.1

While biodegradability is a property inherent to many bio-based products (products made from renewable feedstocks - see Factsheet #1 on What are bio-based products?), there are also quite a few fossil-based chemicals and polymers on the market that are completely biodegradable. Examples of these are the fossil-based polymers polybutylene adipate-co- terephthalate (PBAT) or polycaprolactam (PCL) that degrade completely, too.

NOT ALL BIODEGRADABLE PRODUCTS ARE MADE FROM RENEWABLE RESOURCES. VICE VERSA, NOT ALL BIO-BASED PRODUCTS ARE BIODEGRADABLE.

MYTH N.2

Biodegradation takes quite a bit of time. How much exactly, is very dependent on the environment. In industrial composting (see below), materials need to biodegrade within six months, but in open environments, it will take much longer, often at least a year or several years. And if you wait for hundreds of years, even “durable” goods will start to degrade.

HOME COMPOSTING AND INDUSTRIAL COMPOSTING ARE NOT THE SAME. HIGHER TEMPERATURES AND CONTROLLED CONDITIONS MAKE INDUSTRIAL COMPOSTING A MUCH EASIER ENVIRONMENT FOR PLASTICS TO DECOMPOSE.

MYTH N.3

Now it gets complicated.

Firstly, throwing waste into the environment is never a good idea.

Secondly, biodegradability is a very broad term and does not automatically mean that a product will degrade in any environment.

Degradation is dependent on factors such as temperature, time and the presence of bacteria and fungi in the specific environment.

Below is a list of the most used and misused terms and a picture that gives an overview of the different environments that determine the biodegradability of different polymers. In most cases, biodegradability means that these products will only degrade under specific conditions and not in the open environment. And on top of that, the biodegradability of the final product is not just determined by the properties of its polymer, but also by additives or organic fillers etc. that are added for final consumer products. As said before, it is complicated.

MYTH N.2

While biodegradability is a property inherent to some bio-based products, many of them are durable (which means they will not biodegrade in any case).

This is in fact the case for bio-based versions of traditional fossil-based plastics (such as bio-based polyethylene (BioPE) or polyethylene-terephthalate (BioPET)). These bio-based materials are chemically identical to the fossil-based ones, so they carry the same properties. They are also called drop-in solutions.

But there are also novel bio-based polymers that are durable, such as bio-based polyethylene furanoate (PEF), which is expected to enter the market in 2017. PEF is primarily aimed for bottle production and is said to have better barrier properties than PET, which is commonly used for bottle production.

BIODEGRADATION IS NOT ALWAYS BIODEGRADATION – DETAILS ARE IMPORTANT. TIME IS KEY, AND ALSO THE TEMPERATURE AND PRESENCE OF MICROORGANISMS IN THE SPECIFIC ENVIRONMENT.

BIODEGRADATION IS A CHEMICAL PROCESS, DISINTEGRATION IS A PHYSICAL PROCESS. BOTH HAVE TO OCCUR TOGETHER, FOR A PRODUCT TO DECOMPOSE COMPLETELY.

THE MOST IMPORTANT TERMS AROUND BIODEGRADABILITY & WHAT THEY ACTUALLY MEAN

TERM	END RESULT	HOW	REMARKS
BIODEGRADATION	Carbon dioxide, methane and biomass	Chemical process; micro-organisms break down the material to CO2 methane and biomass, using oxygen & biomass	Biodegradation and disintegration have to occur together for a material to decompose completely
DISINTEGRATION	Little– sometimes even microscopic – pieces of material	Physical process; break down of material caused by factors like wind and weather, tear force, UV radiation, microbial activity, etc.	
OXO-BIODEGRADABILITY/ OXO-DEGRADABILITY/ OXO-FRAGMENTABILITY	Microscopic plastic particles remain	Oxo-degradable materials only disintegrate (= break down), no chemical conversion takes place	Oxo-biodegradability is a misleading term (because there is no real degradation, only disintegration, & microplastics remain in the environment); huge opposition to this term from science, society and policy. Now frequently called oxo-fragmentability

TERM	END RESULT	HOW	REMARKS
COMPOSTABILITY	Carbon dioxide, methane and biomass which can be used as compost	Biodegradation and disintegration take place to produce compost	See the difference between industrial composting and home composting
INDUSTRIAL COMPOSTING	Carbon dioxide, methane and biomass which can be used as compost	Biodegradation and disintegration take place in an industrial facility to produce compost; controlled environment, high temperatures	Due to high temperatures, this is much quicker than home composting; standardised in norm EN 13432
HOME COMPOSTING	Carbon dioxide, methane and biomass which can be used as compost	Biodegradation & disintegration take place in, i.e. a garden to produce compost; changing environment, lower temperatures (depending on region)	Takes much longer than industrial composting; some bio-based materials need higher temperatures to biodegrade than home composting can achieve. So if a bio-based plastic is labelled compostable according to EN 13432, it does not mean it will also be home compostable
BIODEGRADATION IN SOIL, FRESH WATER OR SEA WATER	Carbon dioxide, methane and biomass	Biodegradation and disintegration take place in open environment; changing conditions, sometimes very low temperatures; low population of micro-organisms like bacteria and fungi (which are needed for the process)	Open environment is the most difficult condition for biodegradation; especially the cold sea water with low population of micro-organisms makes it hard for materials to decompose

BIODEGRADATION VS. DISINTEGRATION

Biodegradation means that a material goes through a chemical reaction in which it uses oxygen (O₂) and hydrogen (H) from the material itself or from its environment and then dissolves into water (H₂O) and gases such as carbon dioxide (CO₂) and methane (CH₄) or also new biomass. For this reaction to take place, micro-organisms also need to be in place. This means that – in the ideal chemical process – nothing remains of the original material. Disintegration means that materials break down physically into little – sometimes even microscopic – pieces. This can be caused by a multitude of factors, such as wind and weather, tear force, UV radiation, microbial activity, etc. Even though the remaining pieces might not be visible to the naked eye after this process, they are still there. If a material biodegrades, both processes usually take place: the material first breaks down into smaller pieces, and later, the real biodegradation starts after which, only water, CO₂ and biomass are left.

OXO-BIODEGRADABILITY, OXO-DEGRADABILITY, OXO-FRAGMENTABILITY

Now it gets tricky. Oxo-degradability is a term invented by plastics manufacturers that is clearly misleading. As opposed to being really biodegradable (that is, going through the reaction described above), oxo-degradable materials only disintegrate into microscopic pieces when exposed to sunlight and oxygen. Which means, they do not disappear, but stay in the environment for a very long time, often as microparticles (also called “microplastics”). There has been more and more opposition to this term from society and science and these materials are now frequently called oxo-fragmentable to make clear that they only fragment (that is, fall apart into smaller pieces) and do not properly degrade.

COMPOSTABILITY

Compostability is a term used for products which are suitable for organic recycling (i.e. compostable in an industrial composting plant). This means it is one kind of biodegradation in a specific environment, but in order for a product to be called “compostable”, it also needs to fulfil other requirements, such as disintegration in a defined time, no harmful substances or ecotoxicity. These requirements are laid down in European standard EN 13432 Requirements for packaging recoverable through composting and biodegradation – Test scheme and evaluation criteria for the final acceptance of packaging (2000).

HOME COMPOSTING VS. INDUSTRIAL

If a material is compostable, it does not automatically mean that you can add it to your garden compost to begin composting. Usually a distinction is made between home compostability and industrial compostability. In the garden, temperatures and volumes are a lot lower than those in industrial composting facilities, and conditions are less stable. Consequently, the process also works slower under home composting conditions. Products labelled as “home compostable” need to demonstrate at least 90% biodegradation within a year at temperatures of below 30 degrees and at least 90% disintegration within six months. In an industrial composting facility, conditions are controlled and constant. There are usually temperatures of over 50 degrees, in which industrially compostable materials degrade in approximately three to six months.

Products that need a thermal trigger to start degrading (for example PLA) will be compostable in an industrial composting facility, but will remain intact under home composting conditions.

BIODEGRADATION IN OUR NATURAL ENVIRONMENT: SOIL, FRESHWATER OR SALT WATER

For a few materials, it is actually true that they will degrade in specific open environments, such as in soil, fresh water or salt water. This is still not an excuse for littering – but it might be a good idea for products that typically end up in these environments (i.e. agricultural mulch films for soil, fishing nets for the ocean).

However, again the problem is in the details: soil, fresh water and salt water are very different environments and make biodegradation harder or easier, depending on a number of different factors.

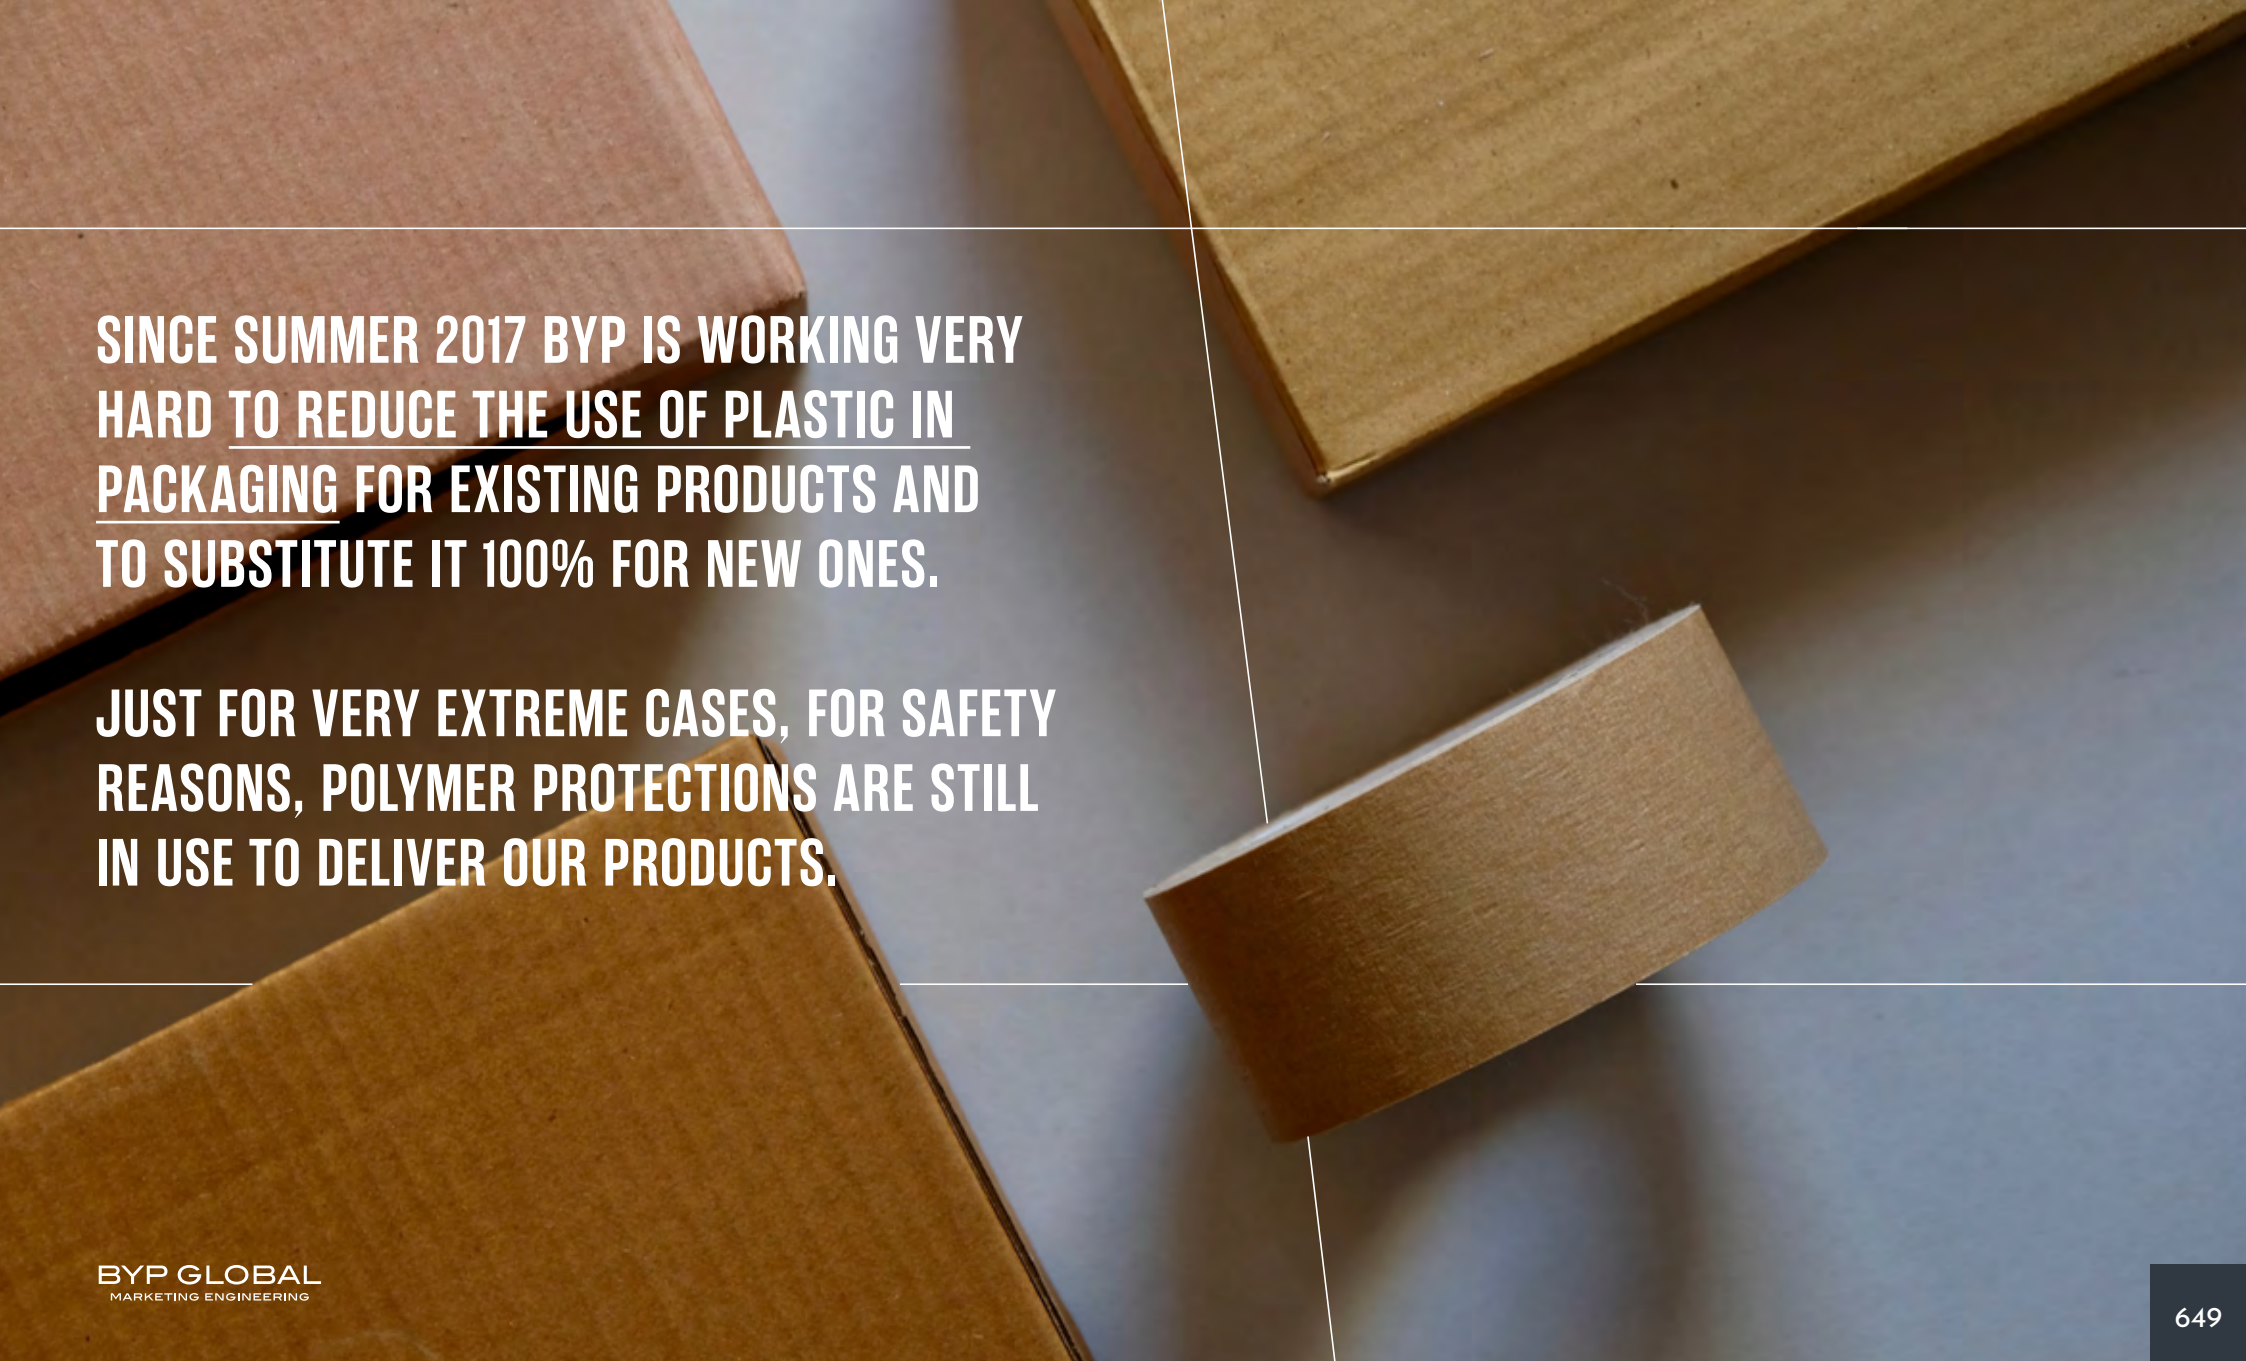

What these environments have in common is that temperatures are below 35 degrees.

The differences are mostly the presence of bacteria and fungi. In water, there are no fungi, which are helpers for biodegradation.

That means that the cold, fungi-free ocean is actually the hardest place for materials to biodegrade, whereas it is much easier in soil.

The conditions in soil are comparable to those in home composting, however, the time required is a lot longer. There are different test methods that can verify the biodegradability of materials in these very specific conditions, but research on their validity and optimisation is still going on.

SINCE SUMMER 2017 BYP IS WORKING VERY HARD TO REDUCE THE USE OF PLASTIC IN PACKAGING FOR EXISTING PRODUCTS AND TO SUBSTITUTE IT 100% FOR NEW ONES.

JUST FOR VERY EXTREME CASES, FOR SAFETY REASONS, POLYMER PROTECTIONS ARE STILL IN USE TO DELIVER OUR PRODUCTS.

SOME OF BYP'S SUSTAINABLE PRODUCTS

CORONA PLA SUSTAINABLE BUCKET

Ref. CRN09009

● PLA Plastic

22 x 19 cm

It comes from biobased raw materials, converted to a polymer resin. The bucket is 100% sustainable: when its lifespan ends the bucket can be recycled, composted or planted in the ground.

SOME OF BYP'S SUSTAINABLE IDEAS

1

Its body is entirely made of wood, the inside bucket in PLA plastic. At the end of its lifespan it can be **100% recycled, composted or planted in the ground.**

2

This Corona ice bucket is entirely made of recyclable pinewood; at the end of its lifespan it can be **used alternatively as a shelf, giving the product a new life.**
